

Thuraya GSM

About Thuraya MarineComms

Thuraya MarineComms gives merchant and fishing vessels alike the ability to access the vital information needed to make the best of the days and weeks at sea. Our high-speed broadband terminals and mobile satellite phones provide you and your crew with voice calls, fax, SMS and Internet services at affordable rates, while giving your vessel access to navigation and weather data, satellite imagery, and emergency calls to keep you safe and informed.

About Thuraya GSM

The innovative Thuraya GSM Solution provides added convenience for users needing to communicate outside of the GSM network range. It is used to extend GSM services to remote locations (mobile locations) with Thuraya IP as the backbone link. It gives end-users added mobility, more freedom and fewer restrictions on their communications.

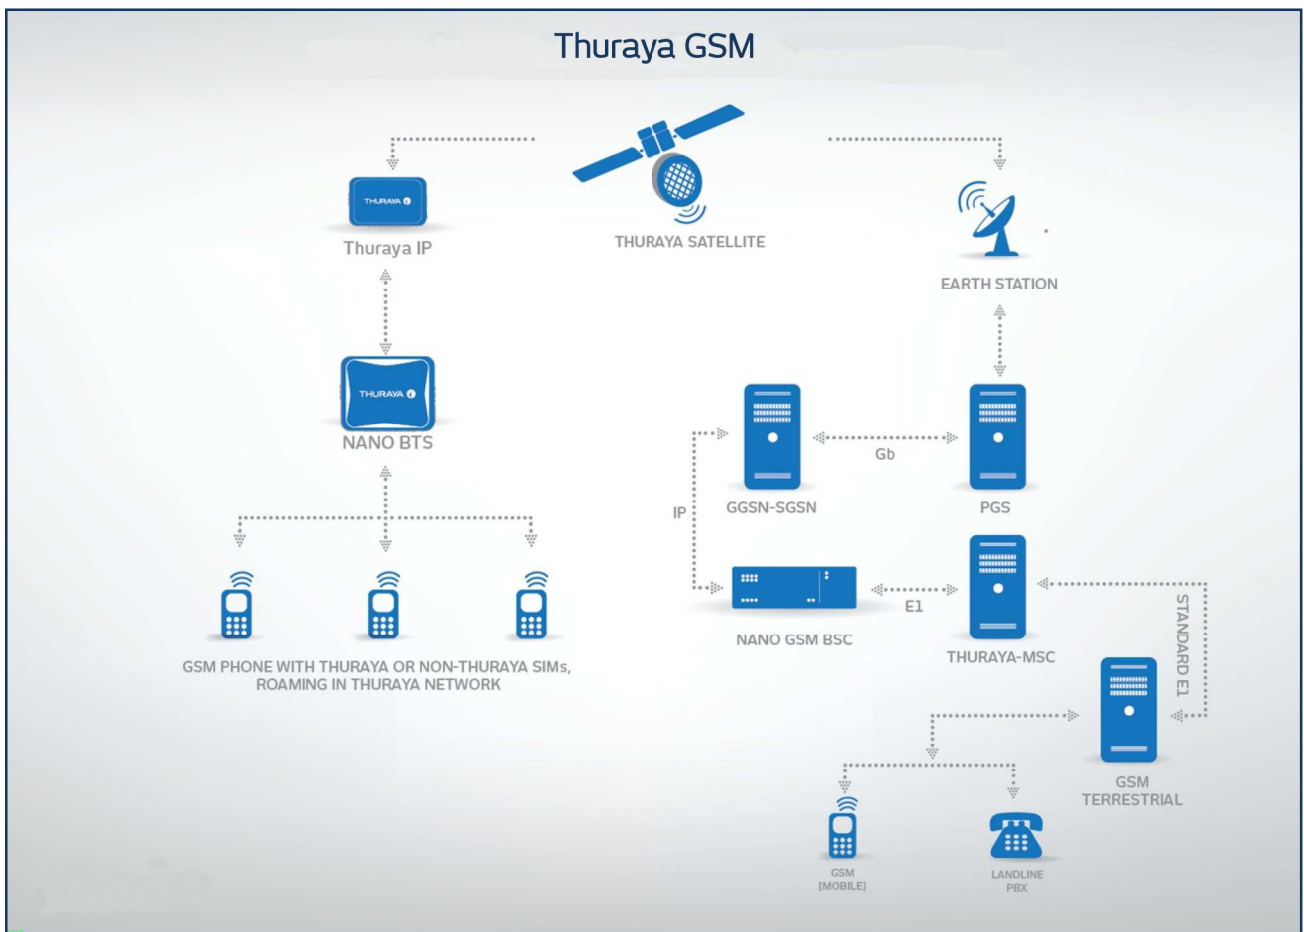

Who uses this solution?

Thuraya GSM is an excellent solution, which can accommodate the various communication needs of the Oil & Gas industry. It is an ideal companion for organizations with units on the move who need to rely on clear, steady connectivity and uninterrupted communications.

How does it work over Thuraya IP?

Thuraya GSM users can enjoy the convenience of using a GSM phone in remote locations since the calls are actually established over satellite in the packet mode. Its main function is to allow GSM roaming in remote and isolated locations where GSM services are generally not available. The IP access is used along with THIP terminals in both standard and streaming mode if needed. Users of this reliable solution can enjoy several benefits such as the ease of deployment of remote GSM networks and its simple, swift operation.
