About AEP

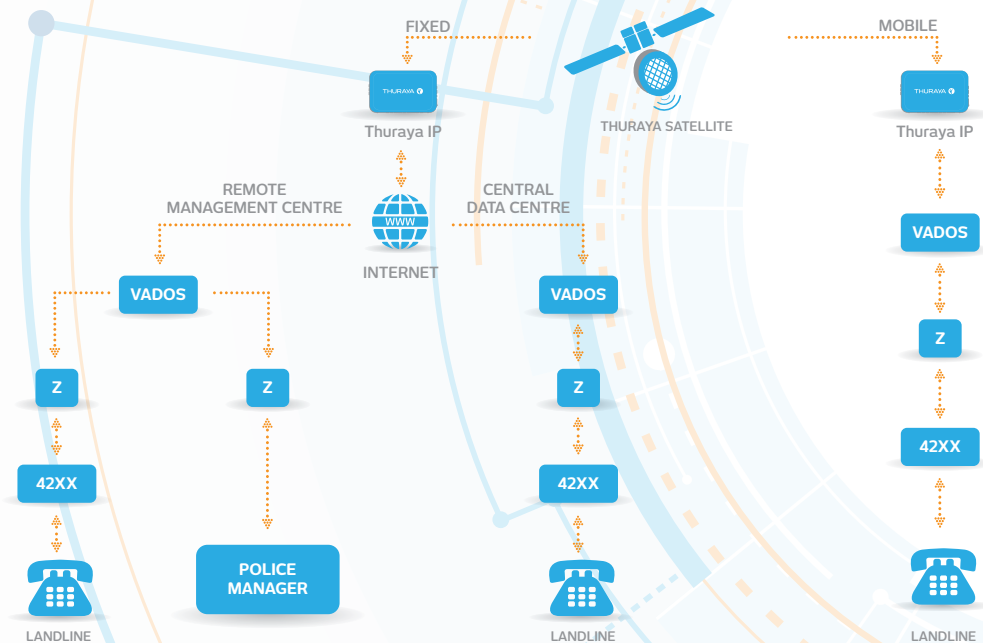

Highly effective and scalable, AEP is a defense grade solution from Ultra Electronics used for encrypted communication between two locations. AEP offers port and hardware encryption, and also lets you extend your head office into any number of remote locations.

The Mini Field Service Pack (MFSP) is used together with a central site, and provides the interface between the remote site and the military shore HQ or network operations center. This unique MFSP can connect to ISDN, PSTN, GPRS, Internet and Wireless automatically, eliminating the need for user configuration. Its ability to execute all these services across many different interfaces, along with its ability to auto detect available circuits, makes it a very flexible, resilient and user friendly solution.

How does it work over Thuraya IP and IP+?

AEP is used in conjunction with the Thuraya IP and IP+. Communications between two remote locations is achieved by using routers, which are capable of giving the outputs to connect voice, fax and data over Thuraya's highly reliable a network simply by using a Thuraya IP terminal. Encryption is a key feature that ensures the communications link is secure, preventing eavesdropping.

Compact and durable Thuraya IP or IP+ is used as the primary data link for this solution. Both standard and streaming services can be used behind the AEP solution. Users benefit from ease and speed of deployment, and customizable encryption for complete security.

Who uses this solution?

AEP solution is used primarily by the military, governments or organizations with a need for swift, secure and easily-deployable communications solutions when conventional forms of communications may not be accessible. AEP lets users move around freely without having to rely on a fixed communications infrastructure. Locations can be changed accordingly while ensuring that a secure communications link can be established within minutes.
