About Thuraya NettedComms

Large-scale, mission-critical assignments involving multiple teams in remote areas present a major communications challenge. How do you coordinate and streamline links between operatives who are using different devices and networks – such as radio, landline and mobile – while maintaining security and network integrity? How do you ensure uninterrupted service in places where radio reception is poor?

In association with Speakerbus, Thuraya has developed a turnkey solution for secure interoperability between multiple users on land and at sea. Thuraya NettedComms is a collaboration platform that coordinates communication from multiple devices and locations, creating an integrated, coherent and easy-to-access network. With Thuraya NettedComms, you can quickly establish a single remote headquarters to handle all your communications on a dedicated secure network, underpinned by Thuraya's IP broadband terminals and network.

How does it work over Thuraya IP broadband terminals?

The headquarter is equipped with a Thuraya IP broadband terminal, which as a native IP device connects seamlessly to the radio gateway via Ethernet cable. The satellite connection is utilised when terrestrial links are unavailable or unreliable, or when "over-the-horizon" communications are needed. Users at multiple locations can talk instantly to a pre-defined group with a single press of a button. The solution has the flexibility to provide instant, open audio or video conferences over local, wide area or global networks, and is scalable to include thousands of users.

Who uses this solution?

Thuraya NettedComms will ensure interoperability for any organisation wishing to coordinate dispersed and disparate voice communications at land or at sea. It provides a secure, cost-effective solution on land for government agencies, security or defence teams and large-scale enterprises, and works equally well in marine environments.

Thuraya IP broadband terminals certified to work with Thuraya NettedComms:

Thuraya IP+, Thuraya IP, Thuraya IP Voyager and Thuraya MCD Voyager
